相

# Women in Physics and Astronomy, 2019 

By Anne Marie Porter and Rachel Ivie

## Highlights

- In 2017, women earned $21 \%$ of physics bachelors' degrees and $20 \%$ of physics doctorates. In that same year, women earned $33 \%$ of astronomy bachelors' degrees and 40\% of astronomy doctorates.
- In recent years (2007-2017), the percentage of women earning a bachelor's degree in physics and astronomy has not changed over time. However, the percentage of women enrolling in physics graduate programs and earning a physics doctorate has continued to rise.
- In 2017, there were 21 physics departments at four-year institutions that awarded $40 \%$ or more of their bachelors' degrees to women, and 21 physics departments that awarded $30 \%$ or more of their doctorates to women. There were 13 women's colleges offering a physics bachelors' degree program in 2017.
- In 2013, 46\% of high school physics students were young women, and this percentage has remained stable since 2003. In addition, $37 \%$ of high school teachers were women, and this percentage has grown over time.
- In 2014, 16\% of physics faculty members and $19 \%$ of astronomy faculty members were women. In 2016, 26\% of newly hired physics faculty members and $40 \%$ of newly hired astronomy faculty members were women. The percentage of faculty members who are women is increasing over time.
- In 2014, women occupied only $10 \%$ of full professor positions, but this is due to women earning fewer doctoral degrees in the past. When comparing the percentage of women employed as professors with past doctorate completions, there were as many women in full professor positions as expected, and more women in assistant and associate positions than expected.
- African-American and Hispanic women remain under-represented in physics and astronomy. However, the number of Hispanic women earning physics and astronomy degrees is growing rapidly over time, while the number of African-American women has not shown similar growth.
- Gender differences in salary emerge mid-career. For recent physics graduates, there were no gender differences in salary one year after graduation; however, men had 10\% higher salaries than women 10-15 years after graduating with a physics doctorate.
- Compared to men, women reported that their careers progress more slowly and that they received fewer career resources and opportunities. In addition, women were more likely to make career compromises for family reasons.

The authors wish to thank our colleagues from the Statistical Research Center at the American Institute of Physics for assisting with the analyses in this report: Starr Nicholson, Patrick Mulvey, Jack Pold, John Tyler, and Susan White.

## Introduction

The participation of women in physics has greatly increased since the 1920s (Figure 1); however, the proportion of women among physics students and faculty members is still below that of other disciplines. Women earn over $50 \%$ of all bachelor's degrees (National Center for Education Statistics, 2016), but women earn only $21 \%$ of physics and $33 \%$ of astronomy bachelors' degrees.

Figure 1

This report will provide a comprehensive overview of the representation and participation of women in physics and astronomy fields. This report has three main goals:

1) To describe the representation of women in high school physics enrollment, physics and astronomy degree completions, and faculty employment. Data are graphically displayed over many years, but the emphasis in our discussion is placed on changes in the most recent decade. In addition, we will examine the representation of minority women at these levels.
2) To compare employment outcomes for men and women with physics and astronomy degrees by exploring potential gender differences in salary, job satisfaction, career opportunities, career resources, and family influences.
3) To identify points of attrition for women in physics and astronomy between postsecondary education and faculty employment. For example, we will examine the percentage of attrition at the faculty member level based on women's past doctorate degree production.

In this report, we used physics and astronomy data collected by the Statistical Research Center at the American Institute of Physics. We obtained data on students from the Enrollments and Degrees Survey and data on faculty members from the Academic Workforce Survey and the Faculty Member Survey. Data on other academic fields were obtained from the Integrated Postsecondary Education Data System (National Center for Education Statistics [NCES], 2016), and the Survey of Earned Doctorates (National Science Foundation [NSF], 2016).

## Students and Degrees

High school students. In 2013, we estimate that 1.38 million students were enrolled in high school physics courses. While the number of young women enrolled in high school physics courses has grown, so has the number of young men. Thus, the percentage of young women in physics courses has remained stable around $46 \%$ since 1997 (Figure 2; White and Tesfaye, 2014).

Figure 2

During high school, many young women participated in Advanced Placement (AP) physics programs. The AP Program offered four physics exams in 2017: Physics 1, Physics 2, Physics C: Mechanics, and Physics C: Electricity and Magnetism. Physics 1 and 2 are algebra-based courses, and Physics C courses are calculus-based. Figure 3 shows the number and percentage of young women who participated in the four AP physics exams. Around 160,000 students participated in Physics 1 exams, and $40 \%$ of test-takers were young women (The College Board, 2017). Around 90,000 students participated in the other three exams, and between $24-28 \%$ of Physics 2 and Physics C test-takers were young women. Although the representation of young women among Physics 1 exam-takers was higher than the other exams, the percentage earning a "passing" score (3 or higher) was lower (Figure 4). 30\% of young women passed the Physics 1 exam, compared to $48 \%$ of young men. However, in the other exams, there was a smaller difference between the percentage of young women and young men who passed the exams.

## AIP Statistics

aip.org/statistics

Bachelor's degrees. Women remain under-represented among physics bachelor's degree recipients. According to our 2017 Enrollments and Degrees Survey, over 8,500 students were awarded bachelor's degrees in physics, and $21 \%$ of degrees were earned by women. Although the number of women earning physics bachelor's degrees has steadily increased over the last decade (Figure 5), the percentage of women has not increased (Figure 6). Since the percentage of women has shown little change between 2007-2017, bachelor's degree completion is increasing at similar rates for men and women.

Figure 5

Number of Bachelor's Degrees Earned in Physics, Classes 1982 through 2017

Source: AIP Statistical Research Center, Enrollments and Degrees Survey.
AIP $\mid$ Statistics
aip.org/statistics

Figure 6

The representation of women in astronomy is higher than in physics. In 2017, over 500 astronomy undergraduates were awarded bachelor's degrees, and $33 \%$ of these degrees were earned by women (Figure 7). While the number of women earning astronomy degrees has steadily increased between 2007-2017 (Figure 8), the number of men earning degrees has shown greater increases. Therefore, the total percentage of women earning astronomy bachelor's degrees has decreased in recent years ( $33 \%$ in 2017 compared to $40 \%$ in 2007).

Number of Bachelor's Degrees Earned in Astronomy, Classes of 1972 through 2017

Source: AIP Statistical Research Center, Enrollments and Degrees Survey.
AIP Statistics
aip.org/statistics

Figure 8

Source: AIP Statistical Research Center, Enrollments and Degrees Survey.
AIP Statistics
aip.org/statistics

Doctoral programs and degrees. The percentage of women earning physics doctorates and enrolling in doctoral programs has increased in recent years. In 2017, over 1,800 doctorates were awarded in physics (Figure 9) and 20\% of these were earned by women (compared to $18 \%$ in 2007; Figure 6). Among first-year physics graduate students, $22 \%$ were women (compared to 18\% in 2007; Figure 10).

Figure 9

Number of PhDs Earned in Physics, 1972-2017

Source: AIP Statistical Research Center, Enrollments and Degrees Survey.
AIP $\mid$ Statistics
aip.org/statistics

Figure 10

As with bachelor's degrees, the representation of women earning astronomy doctoral degrees and enrolling in graduate school was higher than in physics, and the percentage of women in astronomy at the doctoral level has increased in recent years. In 2017, 186 astronomy doctorates were awarded (Figure 11), and women earned 40\% of doctoral degrees (compared to $28 \%$ in 2007; Figure 8). Women were also $40 \%$ of first-year astronomy graduate students (compared to $36 \%$ in 2007; Figure 12).

Figure 11

Number of PhDs Earned in Astronomy, 1972-2017

AIP Statistics
aip.org/statistics

Figure 12

STEM field comparisons. Women are under-represented in physics and astronomy, but this is not true for all fields in STEM (Science, Technology, Engineering, and Math). Figures 13 and 14 show the percentage of women who earned bachelor's and doctoral degrees across STEM fields between 1984 and 2016. At both degree levels, biological science and chemistry have the highest percentage of women, while physics, computer science, and engineering fields have the lowest (NCES, 2016; NSF, 2016). Astronomy has a higher percentage than physics, but still has a lower percentage compared to biological science, chemistry, and, at the bachelor's level, mathematics. Overall, this demonstrates a gap in women's representation between physics, astronomy, and many other STEM fields, and this gap has not changed in recent years.

Figure 13

## Percent of Bachelor's Degrees Earned by Women in Selected Fields, Classes of 1981 through 2016

Figure 14
Percent of PhDs Earned by Women in Selected Fields,
Physics departments. Some physics departments in the United States award more physics degrees to women than others. Table 1 lists the 21 physics departments at four-year institutions that awarded 40\% or more of their bachelor's degrees to women between 2013 and 2017. These departments were mostly located at small private colleges, liberal arts colleges, or Historically Black Colleges and Universities (HBCUs). Table 2 lists the 21 physics departments at four-year institutions that awarded $30 \%$ or more of their doctoral degrees to women between 2013 and 2017. These departments were mostly located at large public
universities. To be included on either list, physics departments must have awarded at least 5 bachelor's or doctorate degrees to women between 2013-2017 and must have consistently provided data on gender and degree completions in the Enrollment and Degrees Survey. This survey has a response rate of over $90 \%$ each year.

## AIP Statistics

## aip.org/statistics

## Teachers and Faculty Members

Although women continue to be under-represented among physics and astronomy teachers and faculty members, the number of women teaching physics at US high schools, universities, and colleges continues to grow over time. About 27,000 high school teachers taught at least one physics course in 2013 (White \& Tesfaye, 2014), and about $37 \%$ of teachers were women (compared to 29\% in 2001). The 2014 Academic Workforce Survey found that there were over 9,000 faculty members working in physics departments and 600 in astronomy departments. Overall, women were $16 \%$ of faculty members in physics departments (compared to $10 \%$ in 2002) and $19 \%$ of faculty members in astronomy departments (compared to $14 \%$ in 2003; Tables 4 and 5).

Academic rank. There is a steady increase in the percentage of women at different academic ranks in both physics and astronomy departments (Tables 4 and 5). In physics departments, more women were represented at adjunct and assistant ranks in 2014, and in astronomy departments, more women were represented at assistant and associate ranks. Although a smaller percentage of women were full professors in both fields, this is likely due to fewer women earning physics and astronomy doctorates in the past. It takes a number of years to transition from assistant to full professor status. Based on the percentage of women among
assistant professors in 2014, we expect the percentage of women among full professors to increase over time as junior faculty gain experience and progress through the ranks. We take a closer look at these expectations in "The Pipeline" section of this report.

Table 4

## AIP |Statistics

## aip.org/statistics

Physics departments. The number and representation of women has increased across all physics departments between 2002 and 2014 (Table 6). When examining departments based on the highest physics degree granted in 2014, PhD departments had the lowest percentage of women, but had the largest number of women. Over 700 women were faculty members in PhD departments, and $14 \%$ of faculty members in these departments were women. Departments that offer a bachelor's degree as the highest physics degree had the highest overall percentage of women. These departments employed over 600 women, and $20 \%$ of faculty members were women. There are very few departments in which a master's is the highest degree granted, which explains why they have the least number of women. These departments employed over 100 women, and women represented $18 \%$ of faculty members.

Table 6

Number and Percent of Faculty Members in Physics Departments Who are Women by Highest Degree Granted, 2002-2014

| Highest Degree <br> Granted | 2002 | $\mathbf{2 0 0 6}$ | $\mathbf{2 0 1 0}$ | 2014 |  |

## AIP $\mid$ Statistics

aip.org/statistics

Ninety-five percent of departments that granted physics PhDs in 2014 employed women in full, associate, or assistant professor positions (Figure 15). Departments offering a bachelor's or master's as the highest physics degree were less likely to have women faculty members, probably due to smaller department sizes and fewer professorial positions compared to PhD departments (White and Ivie, 2013). Therefore, this data should not be taken as evidence that physics departments granting bachelor's or master's degrees are biased against women.

Figure 15

Figure 16 shows how the representation of women in PhD departments has progressed over time. In 2002, over 20\% of PhD departments had no women in professorial ranks, but by 2014, this dropped to around 5\%. Also, as of 2014, 14\% of PhD departments had six or more women in professorial positions, which was very rare in 2002. Table 7 lists the PhD-granting departments with six or more women in professorial ranks. The list includes any departments that responded to the 2014 Academic Workforce survey and provided gender data ( $91 \%$ response rate).

## AIP Statistics

## aip.org/statistics

Astronomy departments. There were 37 astronomy departments in 2014, and the overwhelming majority of them granted PhDs. Due to the small number of departments granting bachelor's or master's degrees as the highest astronomy degrees, we are unable to compare the representation of women in astronomy departments by highest degree granted.

New faculty hires. In our 2016 Academic Workforce Survey, 567 new faculty members were hired in physics departments, and $26 \%$ of new hires were women. Astronomy departments hired 25 new faculty members, and 10 were women. For both fields, the greatest number of women were hired into tenure-track positions, and over time, the number of women hired into tenured, tenure-track, and permanent positions has increased (Figure 17). Although the greatest number of women are in tenure-track positions, the greatest percentage of women were in non-tenure-track positions. In 2016, women were hired into 32\% of non-tenure-track permanent positions, $29 \%$ of temporary positions, $28 \%$ of part-time positions, and $23 \%$ of tenure-track positions.

Figure 17

## AIP $\mid$ Statistics

aip.org/statistics

## Minority Women

Hispanic and African-American women remain under-represented in physics and astronomy. According to the most recent census data (United States Census Bureau, 2010), 13\% of women in the United States are African-American and $16 \%$ of women are Hispanic. When we examined the percentage of minority women earning physics and astronomy degrees in 2016, the representation of African-American and Hispanic women was much lower than the general population of the United States.

Bachelor's degrees. In 2016, 7\% of women who earned bachelor's degrees in physics were Hispanic and 4\% were African-American (NCES, 2016). In recent years, the number of Hispanic women with physics bachelor's degrees has doubled, while the number of African-American women generally has not increased (Figure 18).

Figure 18
African Americans and Hispanic American Women Receiving Physics Bachelors Degrees,
Classes of 1995 through 2016
African-American women were also under-represented among astronomy bachelor's degree recipients; however, Hispanic women were better represented. In 2016, 3\% of women who earned astronomy bachelor's degrees were African-American, and $13 \%$ were Hispanic. Since 2002, the number of Hispanic women earning astronomy degrees has doubled (Figure 19). Astronomy graduates were grouped in 4-year intervals to protect individuals from being identified.

Figure 19

There is a limitation to consider when discussing African-American women and their representation among bachelor's degree recipients. In 2011, NCES began allowing respondents to check multiple races within their survey, and respondents who checked "two or more" races were categorized as "other" rather than African-American, even if one of their choices was African-American. When examining the NCES bachelor's degree data (Figure 18), there is a slight decrease in the percentage of African-American women after 2011, which might be due to the change in classification. Data on African-American women and bachelor's degree completion should be interpreted with caution when using NCES survey results.

Doctoral degrees. In 2016, 5\% of women who earned physics doctorates were Hispanic, and 3\% were African-American (NSF, 2016). In that same year, $4 \%$ of women who earned an astronomy doctorate were Hispanic, and 2\% were African-American. Due to the small number of Hispanic and African-American women with doctorates, the NSF did make data from previous years available to protect individuals from being identified.

Faculty members. In physics and astronomy departments, African-American and Hispanic women continue to be under-represented among academic faculty members (Figure 20). The 2016 Academic Workforce Survey showed that African-American women were only 2\% of all
women faculty members in PhD departments, $3 \%$ of women faculty members in bachelor'sonly departments, and there were no African-American women in master's-only departments. Hispanic women were 4\% of women faculty members in PhD departments, 3\% of women faculty members in bachelor's-only departments, and $14 \%$ of women faculty members in master's-only departments. The number of Hispanic women in faculty positions is growing over time, but the number of African-American women in faculty positions has shown little or no growth since 2008.

Figure 20

Number of Women Faculty Members in Physics and Astronomy Departments by Highest Degree Granted, 2008-2016

Source: AIP Statistical Research Center, Academic Workforce Survey.

AIP $\mid$ Statistics
aip.org/statistics

Summary. In physics and astronomy, both African-American and Hispanic women remain under-represented among degree recipients and academic department employees. However, the number of Hispanic women is growing rapidly over time, while the number of AfricanAmerican women has not grown. Future interventions are needed to find ways that encourage and retain the participation of African-American women in physics and astronomy fields.

## Employment

There were over 250,000 jobs in the physical sciences in 2015 (Bureau of Labor Statistics, 2017), and the number of physical science jobs is predicted to grow by 6.7\% between 2014 and 2024. As physical science jobs become more available, degree recipients in physics and astronomy are pursuing both academic and non-academic career paths. For example, the 2015 Survey of Doctorate Recipients (NSF, 2015) showed that $39 \%$ of physics doctorates work for private businesses and $37 \%$ work for four-year academic institutions. Instead of solely focusing on women employed in academia, we wanted to examine career outcomes for women working across all employment sectors, which includes four-year institutions, two-year colleges, K-12 education, government, and private industry.

This section of the report used data from several different surveys. The AIP Follow-up Surveys of Physics Bachelor's and PhDs contacted physics graduates from the classes of 2015 and 2016 one year after graduation. The 2011 AIP PhD Plus 10 Survey collected data from physics doctorate recipients 10 to 15 years after graduation. The Longitudinal Study of Astronomy Graduate Students, a partnership of AIP and the American Astronomical Society and funded by NSF Award 1347723, collected data from the same group of individuals in 2007-08, 2012-13, and in 2015-16. Lastly, the 2010 Global Survey of Physicists, a partnership of AIP and the Women's Working Group of the International Union of Pure and Applied Physics, collected data from physicists in over 130 countries.

We analyzed gender differences in salary, job satisfaction, career opportunities, doctoral advisor ratings, and family influences. Linear or logistic regression analyses were used to analyze gender differences. In the analyses, we controlled for several employment factors, so any results are attributable to gender differences and not to other factors. Our models controlled for: age, time since receiving a degree, job sector, full or part-time job status, 9 or 12-month salary schedule, and postdoc completion (doctorate analyses only). In analyses with the data from the 2010 Global Survey of Physicists, we also controlled for each country's level of development based on classifications from the United Nations.

Career satisfaction. According to our Follow-up Surveys of Physics Bachelor's and PhDs, women and men who graduated in 2015-16 reported similar levels of satisfaction in their current jobs (Table 8). One year after graduating, there were no gender differences in overall job satisfaction, advancement opportunities, job security, level of responsibilities, level of intellectual challenge, and appropriateness of job for their degrees. In conclusion, this suggests that men and women are similarly satisfied with their current jobs immediately after graduation.

Table 8

| Gender Differences in Job Satisfaction Outcomes |  |  |
| :---: | :---: | :---: |
| Level of Satisfaction | Survey Source | Gender Difference |
| Overall satisfaction | Follow-up Surveys of Physics Bachelor's and PhDs, 2015-16 | No significant difference |
| Intellectual challenge | Follow-up Surveys of Physics Bachelor's and PhDs, 2015-16 | No significant difference |
| Job salary | Follow-up Surveys of Physics Bachelor's and PhDs, 2015-16 | No significant difference |
| Job security | Follow-up Surveys of Physics Bachelor's and PhDs, 2015-16 | No significant difference |
| Advancement opportunities | Follow-up Surveys of Physics Bachelor's and PhDs, 2015-16 | No significant difference |
| Level of responsibility | Follow-up Surveys of Physics Bachelor's and PhDs, 2015-16 | No significant difference |
| Appropriate for degree | Follow-up Surveys of Physics Bachelor's and PhDs, 2015-16 | No significant difference |

## AIP Statistics

## aip.org/statistics

Salary. We found no evidence of salary differences for men and women one year after graduating with a physics bachelor's or doctoral degree in 2015-16 (Table 9). This only includes recent graduates who entered the workforce directly and excludes those who went to graduate school or took postdocs. When we looked at doctoral recipients 10 to 15 years after graduation in 2011, we found that men earned $10 \%$ more than women, even controlling for other factors that could make a difference in salary. In the 2007-2016 Longitudinal Study of Astronomy Graduate Students, we found no gender differences in salary for astronomy doctoral recipients as of 2015-16.

Table 9

Gender Differences in Salary Amounts at Various Career Stages

| Salary Amount | Survey Source | Gender Difference |
| :--- | :--- | :---: |
| Early career physics <br> salaries (1 year after <br> graduation) | Follow-up Surveys of <br> Physics Bachelor's and <br> PhDs, 2015-16 | No significant difference |
| Early and mid-career <br> astronomy salaries (1-8 <br> years after graduation) | Longitudinal Study of <br> Astronomy Graduate <br> Students, 2007-2016 | No Significant difference |

## AIP Statistics <br> aip.org/statistics

Career opportunities. We examined several indicators of career opportunities and advancement among physics degree recipients including promotions, publications, career activities, and perceived resources (Table 10). In our 2011 PhD Plus 10 Survey, men and women had similar numbers of promotions and publications 10 to 15 years after graduation. However, the time to promotion is longer for women in some circumstances. For example, our 2014 Faculty Member Survey data showed that time to promotion to full professor was one year longer for women (for more information on this analysis, see "The Pipeline" section of this report).

Using data from our 2010 Global Survey of Physicists, we found that men reported engaging in more career advancing opportunities than women, even after accounting for differences in age, employment sector, and the development level of their countries. Men were more likely to present at a conference as an invited speaker, become an editor for an academic journal, become a manager, and supervise graduate students. During their careers, women also perceived that they did not receive enough job resources. Compared to men, women were more likely to report not having enough funding, lab equipment, lab space, and employees.

Table 10

## Gender Differences in Career Opportunities, Advancement, and Resources

| Career Opportunities and Resources | Survey Source | Gender Differences |
| :---: | :---: | :---: |
| Number of promotions | PhD Plus 10 Survey, 2011 | No significant difference |
| Number of publications | PhD Plus 10 Survey, 2011 | No significant difference |
| Gave a talk as an invited speaker | Global Survey of Physicists, 2010 | Men were 45\% more likely |
| Acted as a manager | Global Survey of Physicists, 2010 | Men were 33\% more likely |
| Acted as a journal editor | Global Survey of Physicists, 2010 | Men were 27\% more likely |
| Supervised undergraduate students | Global Survey of Physicists, 2010 | No significant difference |
| Supervised graduate students | Global Survey of Physicists, 2010 | Men were 32\% more likely |
| Had enough funding | Global Survey of Physicists, 2010 | Men were 53\% more likely |
| Had enough equipment | Global Survey of Physicists, 2010 | Men were 36\% more likely |
| Had enough office space | Global Survey of Physicists, 2010 | No significant difference |
| Had enough lab space | Global Survey of Physicists, 2010 | Men were 15\% more likely |
| Had enough employees | Global Survey of Physicists, 2010 | Men were 36\% more likely |

## AIP $\mid$ Statistics

Careers and doctoral advisors. Doctoral advisors can have an important influence on women's careers after graduation. In a previous study using our 2007-2016 astronomy data, although all graduate students rated their advisors positively overall, women graduate students reported significantly less positive advisor ratings (Figure 21; Ivie, White, \& Chu, 2016). In the same study, we found that women who reported more negative doctoral advisor ratings were more likely to leave the astronomy field after graduation than men.

Figure 21

Gender Differences in Doctoral Advisor Ratings by Astronomy Graduate Students, 2007-2016

Source: AIP Statistical Research Center, 2007-2016 Longitudinal Study of Astronomy Graduate Students.
Relationship quality was summed across 16 items ( $1=$ strongly disagree; $4=$ strongly agree), and sums ranged from $4-16$. Lower scores indicated more negative advisor ratings.

AIP $\mid$ Statistics
aip.org/statistics

There were similar findings when analyzing data from 2010 Global Survey of Physicists. Although most men and women rated their doctoral advisors positively (either "excellent" or "good"), women graduate students reported significantly less positive advisor ratings (Figure 22). Specifically, more men reported their doctoral advisor as "excellent," while more women reported their doctoral advisor relationship as "good," "fair," or "poor."

Figure 22

## Gender Differences in Doctoral Advisor Ratings by Physics Graduate Students, 2010

Respondents were asked "How would you rate the quality of your relationship with your doctoral advisor during your doctoral studies?"

AIP $\mid$ Statistics
aip.org/statistics

Careers and family. Among physics and astronomy graduates, women's careers were more impacted by their family lives than men's (Table 11). Women were more likely to relocate or decline a job offer because of their spouse's needs, and women were more likely to experience a break in their career for family reasons. Women also made more compromises to balance their career and family life. Women were more likely to choose less demanding schedules, change employers, or become stay-at-home parents.

Table 11

Gender Differences in Career Compromises for Family Reasons

| Career Compromises | Survey Source | Gender Difference |
| :--- | :--- | :---: |
| Relocated for a spouse | Longitudinal Study of <br> Astronomy Graduate <br> Students, 2007-2016 | Women were 204\% more likely |
| Declined job for a <br> spouse | PhD Plus 10 Survey, <br> 2011 | Women were 346\% more likely |
| Had a career break for <br> family reasons | Global Survey of <br> Physicists, 2010 | Women were 400\% more likely |
| Became a stay-at-home <br> parent | Global Survey of <br> Physicists, 2010 | Women were 463\% more likely |
| Chose a less demanding <br> or more flexible <br> schedule | Global Survey of <br> Physicists, 2010 | Women were 111\% more likely |
| Changed employers or <br> field of employment | Global Survey of <br> Physicists, 2010 | Women were 40\% more likely |
| Spent less time at work | Global Survey of <br> Physicists, 2010 | Women were 104\% more likely |

## AIP Statistics

aip.org/statistics

Family influences also impacted women's career progression. Compared to women without children and to men with or without children, women with children reported slower perceived career progress (Figure 23).

Figure 23

Gender Differences in Perceived Career Progression by Parental Status, 2010

Source: AIP Statistical Research Center, 2010 Global Survey of Physicists.

## AIP Statistics

aip.org/statistics

Summary. We found no gender differences in salary or job satisfaction for graduates one year after earning a physics bachelor's or doctoral degree. However, gender differences emerged when examining mid-career physicists with doctoral degrees. Ten years after earning a physics doctorate, women earned a $10 \%$ lower salary than men, which might be due to differences in career opportunities and family influences. As careers progressed, women experienced slower career growth, participated in fewer career advancing opportunities, and reported having fewer job resources. Women were also more likely to make career compromises for family reasons such as limiting their time at work, relocating, or becoming a stay-at-home parent. Gender differences in career opportunities, career resources, and work-life balance seem to limit women from reaching their full career potential.

## The Pipeline: Retention of Women between Education to Employment

Across all stages of physics participation included in this report, women's representation seemingly decreases with each step in the process. In 2013, $46 \%$ of women were enrolled in high school physics, but women earned just 21\% of physics bachelor's degrees and $20 \%$ of physics doctorate degrees in 2017. In physics departments in 2014, 16\% of physics faculty were women and $10 \%$ were full-professors. This can appear to be a decrease of 25 percentage points in women's participation between high school and bachelor's degree completion, and a
decrease of 4 percentage points between women's doctorate completion and obtaining faculty positions. However, the statistics in this report are from a small window of time (2013-2017), and to properly assess attrition or "leaks" in the pipeline, we must compare recent data with appropriate points in the past. For example, we cannot expect $20 \%$ of women to be full professors in recent years if, in the past, women earned a smaller percentage of doctorates.

High school to bachelor's degrees. In 2013, 46\% of high school physics students were young women, and in 2017, women earned $21 \%$ of bachelor's degrees. Although enrolling in high school physics does not necessarily indicate an interest in becoming a physics major in college, the low percentage of physics bachelor's degrees earned by women indicates a drop-off point for women between high school physics and college graduation. We need more data to understand whether this drop occurs before or during undergraduate education.

Bachelor's degrees to doctoral programs. Next, we will examine the transition between earning a physics bachelor's degree and enrolling in a physics doctoral program. Since over 90\% of women who earned bachelor's degrees were US citizens, we only compared women with US citizenship. According to our first-year graduate student survey, most students took no break or a one-year break between undergraduate and graduate education. In the 2016-17 academic year, women with US citizenship earned 20\% of bachelor's degrees in physics. In the Fall of 2017, 21\% of first year doctoral students with US citizenship were women. This demonstrates that there are no gender differences in attrition during this transition.

Doctoral program completion. During their doctoral studies, the middle 50\% of students took 5-7 years to earn their physics doctoral degrees. Between 2010 and 2012, 20\% of first-year graduate students were women, and in 2017, women earned $20 \%$ of physics doctorates. Thus, there appears to be no gender differences in attrition during graduate programs.

The analysis on graduate program attrition included women who were US citizens and foreign women. Foreign women accounted for about 50\% of the women enrolled in 2010-12 doctoral programs and about $50 \%$ of women earning doctoral degrees in 2017. Neither women with US citizenship or women with foreign citizenship showed any attrition during graduate school.

Doctorate degrees to faculty positions. Lastly, we will examine the transition between earning a physics doctorate and becoming a physics professor (Table 12). Based on results from our 2014 Faculty Member Survey, we examined the length of time since doctoral completion for all women who were assistant, associate, and full professors. There was a wide range of graduation years for women who were full professors. The middle $50 \%$ of women graduated between 1980 and 1994. During those years, women earned $8 \%$ of physics doctorates. Ten percent of full professors in physics department were women in 2014, and thus, women were represented at a higher rate than expected in physics departments.

We found similar trends for associate and assistant professors. The middle $50 \%$ of women who were associate professors graduated between 1995 and 2003. During this period women earned $13 \%$ of physics doctorates. In 2014, 18\% of associate professors in physics departments
were women, which was 5 percentage points higher than expected. Finally, we found that the middle $50 \%$ of women who were assistant professors graduated between 2005 and 2010, and women earned $17 \%$ of doctorate degrees during that time. In 2014, $23 \%$ of assistant professors in physics departments were women, which was 6 percentage points higher than expected.

Table 12

## Percent of Women among Physics Faculty Members in 2014 and among PhD Recipients in Previous Years

| Academic Rank | Middle 50\% of Dates <br> Received PhD | Average \% PhDs Earned <br> by Women in Previous <br> Years | \% Women <br> Faculty in 2014 |
| :---: | :---: | :---: | :---: |
| Full professor | $1980-1994$ | 8 | 10 |
| Associate professor | $1995-2003$ | 13 | 18 |
| Assistant professor | $2005-2010$ | 17 | 23 |

Source: AIP Statistical Research Center, 2014 Academic Workforce Survey provided data on the percent of women faculty, and 2016 Faculty Member Survey provided data on PhD earning dates and percent of women earning PhDs in previous years.

## AIP Statistics

aip.org/statistics

Figure $\mathbf{2 4}$ compares the actual and expected percentage of men and women at each academic rank in 2014. Based on the percentage of past doctorate completions, there were as many women in full professor positions as expected, and more women in assistant and associate professor positions than expected. This demonstrates that there is no attrition for women between doctorate completion and employment in professorship positions.

Figure 24

So why are women more represented than expected in physics departments? There are several potential explanations for this. First, past research shows that physics departments may be aware of the under-representation of women among faculty members and make efforts to hire more women. In 2003, although 14\% of physics doctorates were women, $20 \%$ of job offers went to women (National Research Council of the National Academies, 2010). Second, in our 2011 PhD Plus 10 survey data, a significantly greater percentage of men with physics doctorates worked in industry settings compared to women. If more men transition into industry after graduating, this might explain why the representation of women in academia is higher than expected.

Limitations. There is one limitation to our faculty member pipeline analysis. The analysis assumes that men and women take the same amount of time to obtain professorship positions. However, men and women may not advance at the same rate. We conducted a linear regression analysis comparing the years until professorship positions between men and women, controlling for their postdoc experience and the type of academic department (Table
13). There were no gender differences in the time it took to become an assistant or associate
professor. However, the time to promotion to full professor for women was, on average, one year longer than for men. This suggests that women may stay at the associate professor level longer than men, and future research should investigate potential explanations for this finding.

Table 13

## Years Since Degree Across Professorial Ranks for Men and Women, 2014

| Academic Rank | Men | Women |
| :---: | :---: | :--- |
| Full Professor | 15 years | 16 years |
| Associate Professor | 10 years | 10 years |
| Assistant Professor | 5 years | 5 years |

Source: AIP Statistical Research Center, 2016 Faculty Member Survey.

## AIP $\mid$ Statistics

 aip.org/statisticsAttrition in astronomy. In astronomy, we examined women's transitions between earning bachelor's degrees, entering graduate school, and doctoral completion. As with physics, most students did not take a break or took a one-year break between their undergraduate and graduate education. In the 2016-17 academic year, women earned 33\% of astronomy bachelor's degrees, and in the Fall of 2017, 40\% of first-year astronomy doctoral students were women. It is possible that a greater percentage of students entering astronomy doctoral programs are women, but this comparison is not exact because most astronomy graduate students earn a bachelor's degree outside astronomy. Based on our 2015-16 Follow-up Survey of Astronomy PhDs, around $60 \%$ of women in astronomy graduate programs received their bachelor's degree in other STEM majors. Therefore, comparisons made between the percent of bachelor's recipients and graduate students in astronomy should be interpreted with caution.

In astronomy graduate programs, the middle 50\% of students took 6-7 years to graduate. In 2010-12, 37\% of first year graduate students were women, and women earned $40 \%$ of doctoral degrees in 2017. This suggests that, proportionally, more women completed graduate school in astronomy than men.

We do not have the data to perform pipeline analyses for astronomy at the faculty member level. Therefore, we are unable to examine the expected proportion of astronomy faculty who are women based on past degree completions.

Summary. In conclusion, there is no evidence of attrition for women in physics and astronomy between undergraduate degree completion, graduate degree completion, and obtaining faculty
positions. Furthermore, women are more represented in associate and assistant professor positions in physics than expected. Women may decrease their participation in physics between high school and completing their undergraduate degrees, but more data is needed to understand this transition.

## Conclusions

The participation of women in physics and astronomy has grown substantially over the last few decades, but the representation of women in physics and astronomy is still low compared to other academic fields. Although women receive over $50 \%$ of academic degrees (NCES, 2016), women earned only $21 \%$ of physics bachelor's degrees and $20 \%$ of physics doctorates in 2017. The representation of women in astronomy is still higher than physics. In 2017, women earned $33 \%$ of astronomy bachelors' degrees and $40 \%$ of astronomy doctorates. In the last decade, the percentage of women earning doctoral degrees in physics and astronomy has continued to grow, while the percentage of women earning bachelor's degrees has changed very little.

Fortunately, women are not leaving physics between completing their undergraduate education and obtaining faculty employment. Based on our pipeline analysis, the percentage of women employed in faculty positions matches the percentage of women who received doctorates in the past. If this pattern remains consistent, we predict that the representation of women among physics and astronomy faculty should increase over time since more women are receiving doctorates in recent years. Women may still experience attrition between high school physics enrollment and bachelor's degree completion; however, more data is needed to determine whether this attrition occurs before or during undergraduate education.

When we examined employment outcomes of women with physics and astronomy degrees, we found several gender differences in mid-career employment. In early stages of physics careers, men and women have similar salaries and levels of job satisfaction. However, in later stages of physics careers, men receive a $10 \%$ higher salary than women, and women report having fewer career resources and career opportunities. In addition, women with children report slower career progression and make more career compromises for family reasons (e.g. relocating, working fewer hours, leaving their jobs). The challenges women experience with career resources, opportunities, and family responsibilities seem to negatively impact their career potential.

Lower representation and participation of women, minorities, and other groups in education and employment can impact progress in physics and astronomy fields. Research suggests that diverse teams can lead to increased creativity and productivity (Smith-Doerr, Alegria, \& Sacco, 2017) because there can be more exchanges of unique ideas and experiences and increased access to diverse social networks for information gathering and dissemination. Therefore, physics and astronomy should continue to encourage the representation and participation of women and other groups who can offer unique and diverse perspectives within the scientific community.
